

Title: Hack The Box (HTB) "Conversor" Machine (Easy Difficulty)

Role: Primary Solver

Date: 2025

This project was assigned as part of my university coursework, where our team was challenged to compromise two Hack The Box (HTB) machines, including one on the 'Hard' difficulty and one is free difficulty so we could choose any difficulty. Initially, I felt quite daunted by the 'Conversor' machine. My previous Capture The Flag (CTF) experience was primarily built on picoCTF, and stepping into the HTB environment for the first time was a significant leap. However, I decided to take on the challenge as the primary solver for this machine. To overcome the learning curve, I dedicated my time to researching attack vectors online and discussing strategies with my friends. Through persistence and continuous learning, I successfully exploited multiple vulnerabilities and captured several critical flags. I found the flag for this machine, and this experience was a major milestone. It pushed my technical boundaries, sharpened my analytical skills, and taught me how to adapt quickly to entirely new cybersecurity environments

Title: Network Routing, design, and ip addressing
Role: Primary design, Network Routing and Ip Addressing
Date: 2024

This project was assigned as part of my university coursework, where our group was challenged to make an network routing, design and ip addressing the first floor. eighth floor and sixth floor of binus, it was my fist experience to design, routing and ip addressing. I dont really have any previous experience at all in network, and stepping into the Network environment for the first time was a significant leap. However, I decided to take on the challenge as the primary lead to design and make the design work. To overcome the learning curve, I dedicated my time to researching how to design the network topology, how to routing and addressing the ip online and discussing strategies with my friends. Through persistence and continuous learning, I successfully finish the network and run the network topology, and this experience was a major milestone. It pushed my technical boundaries, sharpened my analytical skills, and taught me how to be more thorough to ensure no ip address that i put is wrong and making sure every single device is working

Title: PicoCTF Security Challenges & Write-Up Documentation

Role: CTF Participant & Write-Up Author

Date: 2025

This project started as an assignment for my Penetration Testing course, challenging us to solve easy to medium labs on the picoCTF platform. Since I had zero prior experience with CTFs, it was honestly quite overwhelming at first. However, by actively researching online and discussing with my friends, I slowly managed to get the hang of it. This hands on process allowed me to myself with essential tools like Wireshark, CyberChef, Hex editor, and Burp Suite, while also helping me discover a strong personal interest in the Digital Forensics category. Beyond just solving the challenges and finding the flags, this project taught me a crucial lesson about the importance of documentation in cybersecurity. I started creating detailed Write-Ups for every forensic challenge I completed, which trained me to translate my raw technical steps into clear, structured reports that is understandable for people that is still new to cyber. This experience didn't just improve my technical problem- solving skills, and built a solid foundation in how to document findings professionally.
